Oregon albacore are caught one at a time using fishing lines attached to outriggers that extend out from the sides of the boat. Tuna is also caught using bait on individual poles. These types of fishing, sometimes called trolling, prevent the accidental catch of other animals (called by-catch) such as sea turtles and dolphins.

Oregon albacore are relatively small, weighing 10-30 pounds.

Fresh tuna can be purchased at stores or right from the dock during the summer and early fall months when the annual catch along the Oregon coast occurs. Frozen and canned fish are available year-round.

Tuna are cleaned and frozen or put on ice just minutes after they are caught.

On average, American’s eat 2.3 pounds of canned tuna per person each year.
